Project Idea

There were not many Event creation and management application which allowed users to add helpers and which were free to use for public.

Our application allows creating public and private events and adding helpers to finish tasks for the event and keeping everyone notified.

Key Features

- Create your event.
- Invite friends your event.
- Assign tasks (e.g. Bring Cake)
- Track each task's status
- Browse public events.
- View all the upcoming events you are part of in the same spot.

Introduction / Problem

When we wish to host a private or a public event like a birthday party to something like a corporate meeting or a girl's night to a college event, it takes a lot of manual efforts to :

- host an event,
- invite friends/family and guests
- assign task to those willing to help.

Also, to view all your events (hosting/attending) in a tabular form can be useful
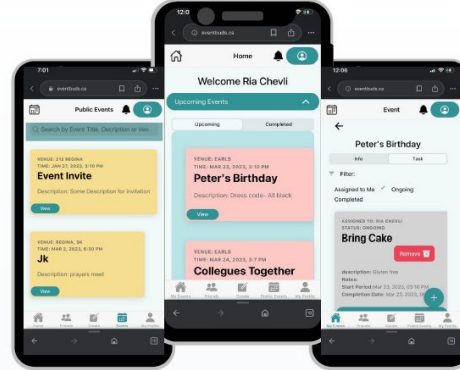

Solution ⇕ Result

Developed an event planning and management cross platform application that is supported on web, mobile devices and tablets.

This app allows users to add friends and helpers to help them complete tasks for their event.

User can also

- create events,
- Browse/join public event,
- Users and helpers can keep track of each task within an event and its progress. We will also provide secure login functionality.

There are other user- friendly functionalities that provide smooth user experience to even non- tech- savvy audience

Key Features

- Create your event.
- Invite friends your event.
- Assign tasks (e.g. Bring Cake)
- Track each task's status
- Browse public events.
- View all the upcoming events for the week in the same spot.

Future Work

We plan to expand the scope of this project and add more user-friendly functionalities like :

- Area locator
- Security –email validation
- Add guests who are not using this application, using email service,
- Adding themes to event creation
